

Nielsen Heuristic Evaluation - aTendy

Individual usability evaluation report for the aTendy Attendance App. Severity scale: 0 = not a problem, 1 = cosmetic, 2 = minor, 3 = major, 4 = usability catastrophe.

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
1	H1-1: Simple & natural dialog	The teacher dashboard is almost empty and only shows a title. The most important teacher tasks are hidden in other pages, and course/lecture tables still expose technical ID columns.		2	Make the dashboard task-oriented: show Create course, Start lecture, Manage enrollments, and View lectures. Hide internal IDs unless needed for support.
2	H1-2: Speak the users' language	Several actions are represented mainly by icons in the Courses table. Start lecture, enrollments, edit, and delete require the user to recognize icons, and edit/delete do not show visible text in the table.		1	Add consistent tooltips and/or named action columns for all icon-only actions, especially edit and delete.
3	H1-3: Minimize users' memory load	The Lectures table shows join codes for all lectures, including old sessions. Teachers must remember which code belongs to the active lecture and which codes are expired.		2	Add clear lecture status labels: active, upcoming, ended. Hide or de-emphasize expired join codes and surface the active code on the dashboard.
4	H1-4: Consistency	The application mixes interaction patterns. Some destructive actions use browser-native confirmation dialogs while other workflows use Material UI dialogs. Loading and empty states also vary across pages.		2	Use one reusable Material UI confirmation dialog and one consistent loading/empty-state pattern across teacher pages.
5	H1-5: Feedback	The live lecture dashboard top cards show present/absent totals, but the Marked and Unmarked summary rows still show "--". This creates conflicting feedback during a live session.		2	Wire the same calculated present and absent counts into the summary rows and refresh live attendance data automatically.
6	H1-6: Clearly marked exits	The Sign up page has no visible "Already have an account? Sign in" link back to the login page. Users who open registration by mistake need browser navigation.		2	Add a sign-in link to the bottom of the Sign up form. Add explicit Back to lectures / Back to courses on the lecture dashboard.
7	H1-7: Shortcuts	There is no direct shortcut to start a lecture from the teacher dashboard. A teacher must go to Courses, find a course, and use the table action.		2	Add dashboard shortcuts for Start lecture, Create course, Upload enrollments, and View active lectures.

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
8	H1-8: Precise & constructive error messages	Login and attendance error handling still relies on generic messages in several cases. Users may see an unknown error without a clear recovery action.		2	Map common errors to specific translated messages and include clear next actions, such as checking credentials, retrying, or contacting support.
9	H1-9: Prevent errors	The Sign up form marks empty fields as invalid, but it does not explain email format or password requirements before submission. Users discover rules late.		2	Add field-level helper text for email format, password length, and password confirmation before submission.
10	H1-10: Help and documentation	There is no Help/FAQ entry, the Forgot password link is not functional, and unknown URLs render a blank page with no recovery path.		3	Add a Help/FAQ page, implement password reset, and create a Not Found page with a button back to the correct dashboard.
