

This activity diagram describes the use case “**Teacher can create a lecture**” for the **Student Attendance application**.

The User flow for this use case is as follows:

- **Login:** at the login stage, user could login as either student or a teacher, for this specific use case the user could only be a teacher because the use case is teacher specific. We check the role in the next step.

- **Check credentials:** here we check if the user is valid, as well as we check and keep track of the user role i.e “Teacher ” or “Student”.
- **Show Dashboard:** in this step we show the dashboard related to the logged in user, for teachers there will be a different dashboard than student.
- **Click on courses:** teacher can navigate to courses page through the nav bar to show all the current courses and the option to create new course.
- **Decision Node 1:** the teacher can Either create a new course, or select existing course, if selecting existing course:
 - **Decision node 2:** check if the course exists then we redirect the flow to creating a lecture inside that course.
- **Start a lecture:** when course is selected, we can start a new lecture inside that course to which students can mark their attendance. The teacher clicks start a lecture, fills in the form(title, description and date) and clicks submit, then the lecture will be created in the database with a unique join code for the students to mark.
