

Nielsen Heuristic Evaluation - aTendy

Individual usability evaluation report for the aTendy Attendance App. Severity scale: 0 = not a problem, 1 = cosmetic, 2 = minor, 3 = major, 4 = usability catastrophe.

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
1	H1-1: Simple & natural dialog	The teacher dashboard is almost empty and only shows a title. Important actions such as creating a course, starting a lecture, or managing enrollments are hidden on other pages.		2	Add task-oriented dashboard shortcuts: Create course, Start lecture, Manage enrollments, and View lectures.
2	H1-2: Speak the users' language	When the Courses page fails, the user sees raw backend JSON with timestamp, status, error, and path. This is technical language rather than a message a teacher can understand.		3	Replace raw server responses with translated, human-readable messages such as "Courses could not be loaded. Please try again later."
3	H1-3: Minimize users' memory load	The Lectures table shows join codes for old lectures together with current lecture data. Teachers must remember which code is active and which lectures are already finished.		2	Clearly mark lecture status as active, upcoming, or ended. Hide or visually de-emphasize expired join codes and show the current active code on the dashboard.
4	H1-4: Consistency	The app uses inconsistent feedback patterns. Some screens show friendly empty states, while the Courses page displays a raw JSON error. Destructive actions also use browser confirm dialogs instead of the app dialog style.		2	Use the same Material UI alert/dialog pattern for all errors and confirmations. Keep wording and visual treatment consistent across teacher pages.
5	H1-5: Feedback	The live lecture dashboard has top attendance cards, but the Marked and Unmarked summary rows still show "--". This weakens live feedback during a lecture.		3	Wire the calculated present and absent values into the summary rows and refresh attendance data automatically while the session is active.
6	H1-6: Clearly marked exits	The Sign up page has no visible link back to Login. A user who opened registration by mistake must use the browser back button or manually change the URL.		2	Add "Already have an account? Sign in" at the bottom of the Sign up form and link it to the login page.
7	H1-7: Shortcuts	There is no quick way to start a lecture from the teacher dashboard. The teacher must open Courses or Lectures first, then find the correct action.		2	Add dashboard shortcuts for common teacher actions, especially Start lecture. A quick dialog could ask for course and lecture details.
8	H1-8: Precise & constructive error messages	The Courses error only says Internal Server Error inside a raw JSON response. It does not explain what happened or what the user should do next.		3	Show a precise message with a recovery action, for example: "Could not load courses. Refresh the page or contact support if the problem continues."

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
9	H1-9: Prevent errors	The Sign up form marks empty fields as invalid, but it does not clearly show email format or password requirements before submission. Users can still discover rules late.		2	Add field-level validation and helper text for email format, password length, and password confirmation before the user submits the form.
10	H1-10: Help and documentation	The app has no visible Help or FAQ entry, the Forgot password link is not functional, and unknown URLs render a blank page with no recovery path.		3	Add a Help/FAQ page, implement password reset, and create a Not Found page with a clear button back to the correct dashboard.
