

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggestions
1	H1-1: Simple & natural dialog	Deleting a course will show an Alert js component that's not aligned with the current app design		2	We should create a reusable component that pops up to ask the user to continue or cancel.
2	H1-2: Speak the users' language	Icons are misleading and courses and lectures have the same icon, which might make the user wonder which one is which.		2	Create separate icon for each item and use more suitable icons instead of a video play icon which is not related to the course nor the lecture.
3	H1-3: Minimize users' memory load	If a course supports multiple languages, the teacher has to remember entering the name for the languages supported by editing the course name while selecting the language.		2	We have to implement a way to let the teacher know which languages are present and which are missing.
4	H1-4: Consistency	In the lecture page, Present/absent icons and texts are different from		2	We should use the same namings and icons for both of them if they mean

		the Marked/Unmarked while they mean the same thing.			the same thing.
5	H1-5: Feedback	The system doesn't tell when creating a course or lecture, it just creates it and then it will show in the list.		2	The system should show a popup, toast or somehow tell the user that item was created successfully.
6	H1-6: Clearly marked exits	Clicking logout in the application will not ask the user for confirmation and it will log out instantly		2	We should ask the user to confirm the logout before actually logging out by mistake.
7	H1-7: Shortcuts	To create a lecture, we have to navigate to the courses page and then selecting the play icon on the course item, which is misleading because we have a separate page for lectures.		2	We should have quick action buttons on the dashboard to create course, lecture as well as in the lecture page to create a lecture.
8	H1-8: Precise & constructive error messages	Error messages are not readable by regular users,		3	We must localize the errors and make them more

		the errors are purely technical			understandable by none tech users.
9	H1-9: Prevent errors	We allow the user to upload any document for enrollments without telling them the supported format (xml), uploading others will through an error.		3	We should tell the user the supported file type as well as give them better error message.
10	H1-10: Help and documentation	Currently we don't have any documentation to let the user know how to perform actions in the platform,		2	There should be a help button that can show information related either to the current page the user is at or one separate page that contains everything and user can search it through.
